

Compass for Compartment Pressure

Measure compartment pressure precisely in just seconds.

So, you've suspected compartment syndrome. But are you 100% sure?

Delays and misdiagnoses can have catastrophic consequences. Nerves and tissue can die and muscles can be damaged quickly.

With compartment syndrome, early detection is vitally important. Patients who receive an early fasciotomy are:

- · 16.1% less likely to experience amputation
- · 7.9% less likely to develop an infection
- · Amongst those likely to have shorter hospital stays.

More than the health of your patient is at stake.

Compass has the potential to prevent an unnecessary fasciotomy or amputation caused by a missed or delayed diagnosis. For example:

- · A young patient who undergoes an unneeded fasciotomy is likely to be left with a 30-cm scar.
- · An athlete's leg may be unnecessarily amputated due to missed compartment syndrome.

Confirming compartment syndrome quickly and confidently can be difficult. However, confirmation is critical for your next course of action.

Treatment delays and misdiagnoses are preventable with the right tool.

Confirmation in seconds

The occurrence of a car accident or a crush or sports-related injury raises the question, 'Does this patient have compartment syndrome?' Confirming compartment syndrome quickly and confidently can be difficult. Often, the current capital equipment is unavailable or locked up, and the consumable components are expired. Combine that with a surgeon who is in a scheduled procedure, and the delays in treatment grow longer. But with Compass, you can get confirmation in seconds.

Confidence to make the call

Early detection of compartment syndrome is key to both management and treatment. The sterile, single-use Compass device provides a simple, precise, indisputable digital pressure reading of compartment pressure, instantly.

Good for you; great for your patients. With Compass, precise pressure is made simple!

Benefits and features

- · Assists in preventing misdiagnoses and the long-term complications caused by delayed diagnoses
- Faster, easier to use and less expensive than existing
- · Compatible with almost all syringes, any gauge needle and all luer connections
- Designed for early, accurate measurement of compartment pressure
- · Available as a single, sterile device
