

***STERILE BARRIER SYSTEM  
FOR SURGICAL INCISIONS.***

**Dermadine® & Dermadrape® Incise Drapes**  
Increased sterility for a higher safety

# DERMADINE® INCISE DRAPE

Cleaning, in preparation for surgery, combined with skin disinfection are two necessary steps for the initial reduction of surface bacteria. However, skin microorganisms are reduced but not eliminated, and can survive in microscopic folds of the skin.

When complete and long-lasting asepsis is required, the Dermadine incise drape guarantees to maintain a sterile field, through its broad-spectrum antimicrobial activity on many microorganisms present on the skin.

The adhesive contains slow-release iodine iodophors which ensure maximum sterility is achieved and sustained over time. It is also suitable for all types of surgical procedure.

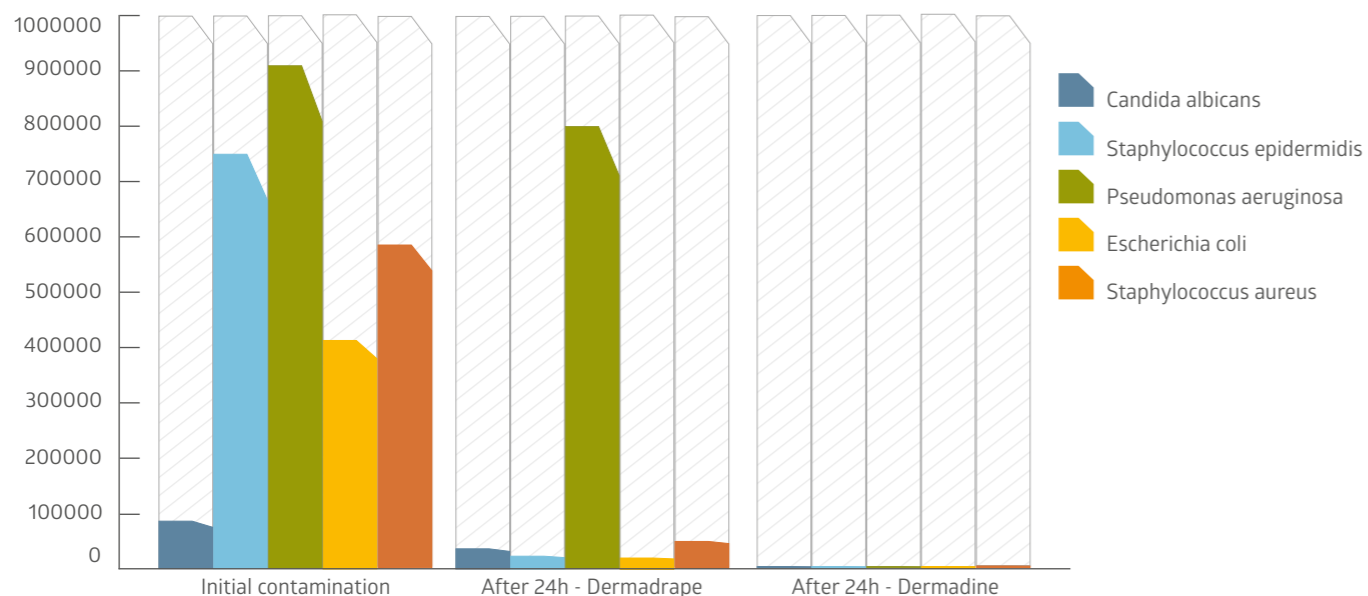

Therefore, Dermadine incise drapes should be used as a final step in preparing the surgical field.

## Long lasting

The presence of iodophor groups affixed to acrylates guarantees a release action and a constant presence of iodine for a considerable time, even beyond 24 hours. This characteristic makes the product suitable for long surgical procedures.

MEASUREMENT OF ANTIBACTERIAL ACTIVITY (AS PER ISO 22196:2011)

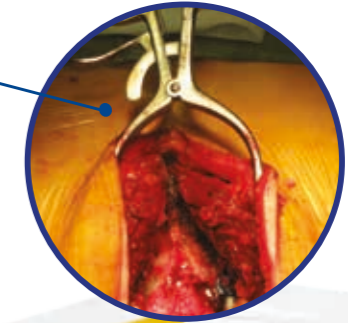

## Fast acting

When applied, the Dermadine incise drape demonstrates strong antimicrobial activity. Within 30 minutes of application of Dermadine, there is a significant reduction in the bioburden, which gradually stabilises over time. Dermadine guarantees constant asepsis on the patient's skin even for long periods of time.

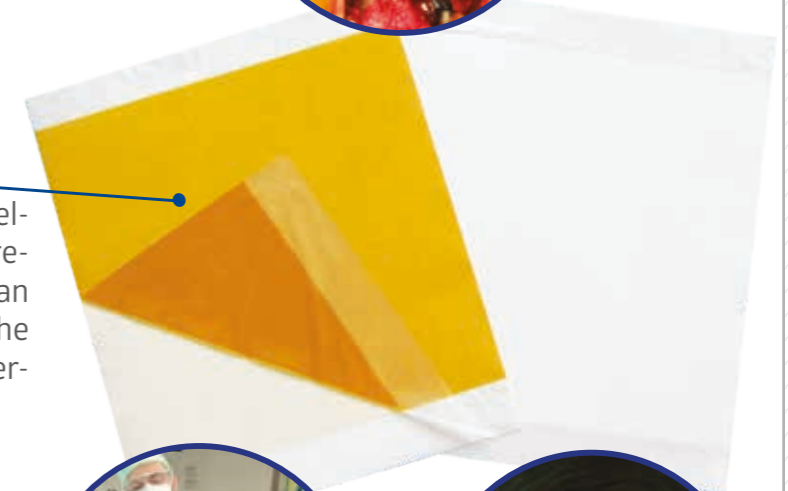

## Conformable and enveloping

Naturally elastic and ultra thin to guarantee a perfect fit and conformation to anatomical structures and joints. Dermadine adapts to large deformations of muscles (even when autostatic retractors are used) without losing its adhesive properties.

## Breathable, water repellent and waterproof

Dermadine combines blood and water repellence with water vapour breathability, to prevent the formation of fluid collection that can reduce adhesiveness during long cases. The breathable film guarantees complete impermeability to microorganisms.

## Strong and anti-glare

In addition to its excellent resistance to tearing, Dermadine also allows easy surgical incision with any scalpel blade and provides indirect protection from tearing for thin skin.

Its anti-glare properties provide perfect visibility at the point of incision under the presence of reflected light.

## Adhesion with the presence of antimicrobial agent

The skin friendly medical adhesive allows high peel adhesion on all types of skin surfaces and especially on the edges of the wound without any skin irritation\*. The poly-acrylic structure in Dermadine's adhesive contains an iodophor complex. A surfactant J-carrier, transports iodine and begins releasing it upon application to the skin. The acrylic adhesive is atraumatic during detachment, even on the skin of elderly patients, and guarantees no residual adhesive after detachment.

## Storage

Store product at room temperature, protected from light and moisture in ventilated areas above floor level, in its protective package. Avoid extreme temperatures.

## Sterilising agent

Gamma radiation

## Disposal

After use, the medical device is considered special waste.

## Medical device classification

DERMADRAPE®: Class IIa  
CND code: T02010101  
DERMADINE® Class IIa  
CND code: T02010102

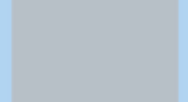

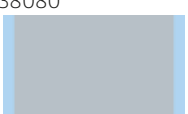

## Packaging

- Packed into individual peelable sterilisation pouch
- Removable labels for traceability and patient files
- Available for sale in smaller dispenser boxes
- Available in Medline SPT customised packs
